

Desktop devices connect to an application server by sending periodic requests over port 443 (HTTPS), potentially receiving content as a response.

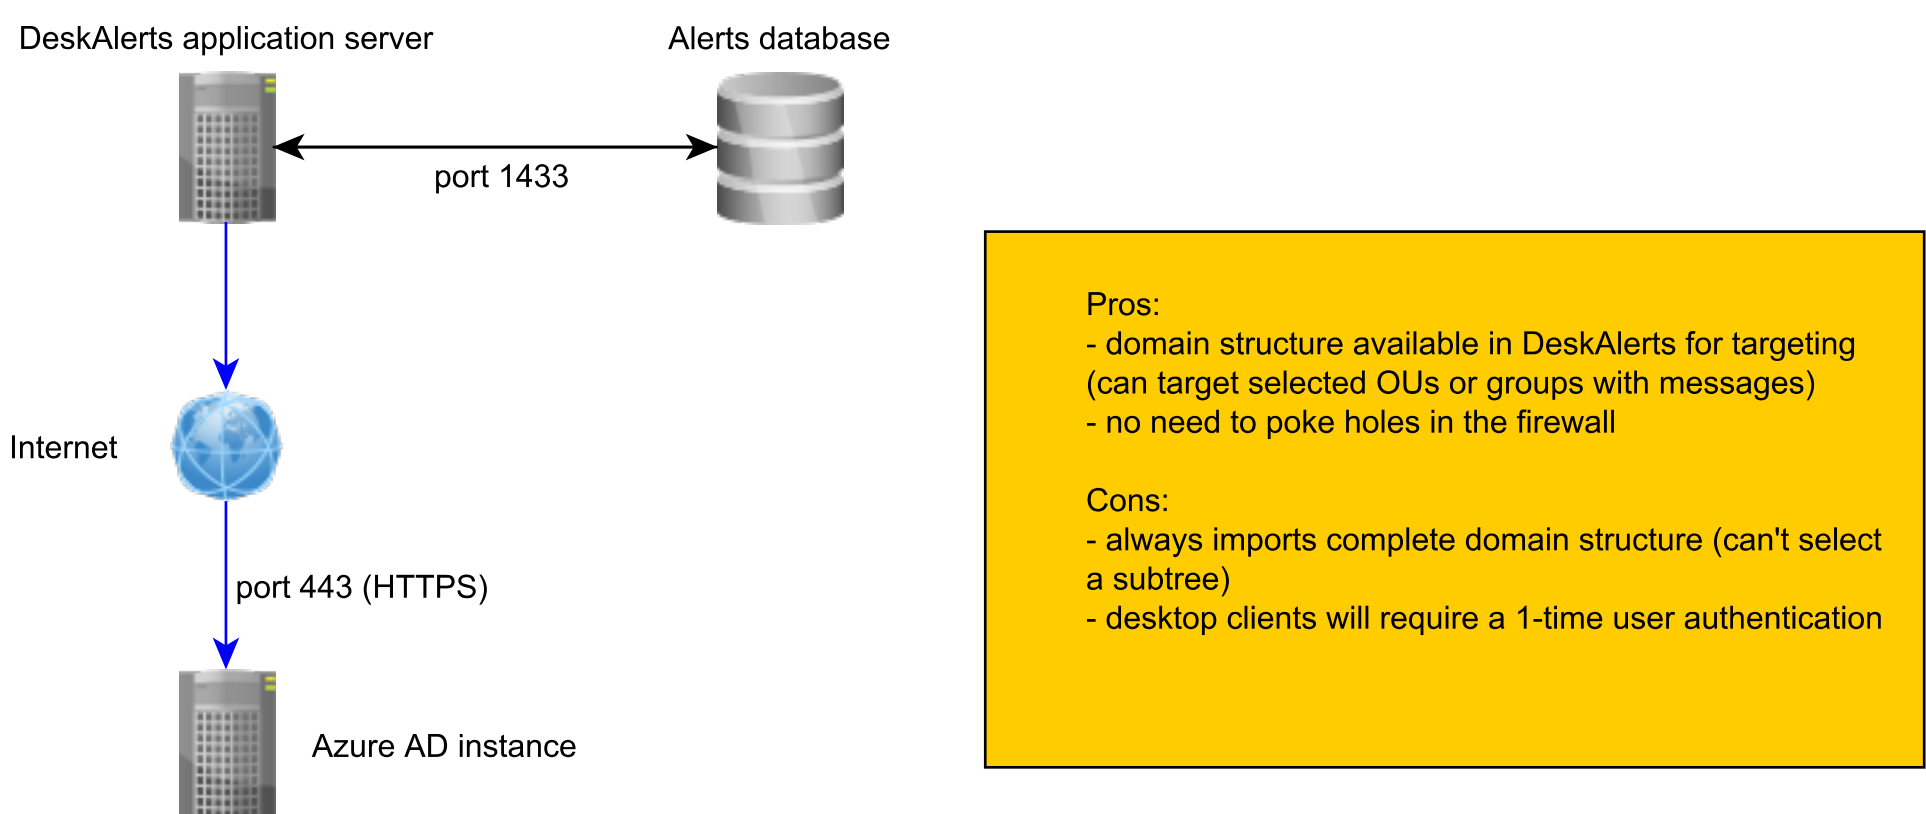

Mobile devices receive push notifications from Apple/Google services, then request the content from Application server over port 443

Active Directory integration option 1. DA Application server connects to one of the domain controllers via LDAPS to retrieve user data

Active Directory integration option 2. DA Application server connects to an Azure AD domain (cloud-based)

Active Directory integration option 3. DeskAlerts desktop clients send current user information to the application server on a periodic basis
